Abstract: Optimization of manipulation activity and testing of collision relations of construction components in the production systems is an important project activity. Particularly in the design of automated manufacturing systems increased attention should be paid to modeling the functional and spatial relationships of components that perform manipulation activities in the production area. The paper characterizes the approach applied to modeling the geometrical relations of the elements in the production system of the dynamic realization of their manipulation activity.

Keywords: production system, designing handling processes, analytical modeling, graphic modeling, coordinate system, working space of production systems, manipulation, collision testing of physical elements of production systems.

1. Model for Collision Testing of Manufacturing System Components for Handling Operations

When projecting production workplaces is needed to optimize the technology sessions, handling, management and other functional areas. Handling operations optimization of the produced object handling is preferably addressed by zonal study. This is based on track movements in handling and it depends on the orientation of the device mounting area and the orientation of the output of the fixture device relative to the robot, and the robot kinematics.

Satisfactory orientation are selected according to two criteria:
1. compatibility orientation and type of the manipulated object oriented movement when removing an object from the mounting device,
2. exclusion of the collision object with a mounting device, it is necessary to determine the path of movement when handling near the mounting device.

When testing the collisions of the components of an automated manufacturing system in its working zone, it is necessary to determine the path of their movements. A partial algorithm for testing the movement path of a robot with a manufacturing object when it is mounted in a clamping device is on the Fig.1. The analysis is based on the following steps:

* Corresponding author: Vladimír Rudy. E-mail address: vladimir.rudy@tuke.sk
Manipulation of an object is tested in the workspace of the production facility in the elementary steps to determine whether there is a collision. This cyclical process is repeated if a collision is detected when inserting an object or output from the device new variants must be analyzed of the manipulation cycle. The process is repeated on other automated manufacturing system equipment.

Fig. 1: A partial algorithm for testing the movement path of a robot.

Testing collision manipulated object with a mounting device, may be performed either graphically or analytically.

For analytical testing we introduce the coordinate system of the robot gripper \( \mathbf{x}_c, \mathbf{y}_c, \mathbf{z}_c \), starting \( \mathbf{O}_c \) in the middle of the jaw object (Tab. 1). Axis \( \mathbf{z}_c \) is the vertical axis direction and \( \mathbf{y}_c \) a direction of travel when moving between devices. All parts of the arm (tentacle and object in it) is approximated to the blocks with edges parallel to the axis \( \mathbf{x}_c, \mathbf{y}_c, \mathbf{z}_c \). The dimensions and location of any such cuboid \( m-th \) (\( m = 1, 2 \ldots M \)) are given by the coordinates of its edges \( x_m, y_m, z_m, x_m, y_m, z_m \) in view of the gripper coordinate system. Given the approximate shape of the device and the object do not overlap feature is the smallest of any vertical coordinates \( x_m, y_m, z_m \) one element of the corresponding largest coordinate \( x_m, y_m, z_m \) the second element.

To express the elements of the robot and devices need to have their expression in a single coordinate system. In this case, it is advisable to use a coordinate system of the robot \( x_P, y_P, z_P \) (Tab. 2).

| Tab. 1: Individual coordinate systems of the production object, the tentacle and the clamping device of the machine. |

<table>
<thead>
<tr>
<th>Grip with object of production</th>
<th>Production machine</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x_c, y_c, z_c ) - coordinates of the beginning of the coordinate system ( j-th ) device in relation to the robot coordinate system,</td>
<td>( x_j, y_j, z_j ) - coordinates of the blocks that approximate elements of the device relative to the coordinate system equipment ( x_j, y_j, z_j )</td>
</tr>
<tr>
<td>( x_m, y_m, z_m ) - coordinates the edges of blocks that approximate elements of the device on the angle ( \alpha ) enclosed by the two coordinate systems.</td>
<td></td>
</tr>
</tbody>
</table>
First, in the coordinate system converted coordinate edge blocks that approximate device elements as follows: 

\[ r'_n = r_j + A_n r_n, \quad r'_n = r_j + A'_n r_n, \]

where 

\[ r'_n = \begin{bmatrix} x'_n \\ y'_n \\ z'_n \end{bmatrix}, \quad r'_n = \begin{bmatrix} x'_n \\ y'_n \\ z'_n \end{bmatrix}, \quad r_j = \begin{bmatrix} x_j \\ y_j \\ z_j \end{bmatrix}, \quad r_n = \begin{bmatrix} x_n \\ y_n \\ z_n \end{bmatrix}. \]

- \( x'_n, y'_n, z'_n \) - coordinate system of the robot \( x_r, y_r, z_r \).
- \( x'_n, y'_n, z'_n \) - coordinates of edges cuboid, most remote in the positive direction of the axis robot \( x_r, y_r, z_r \).
- \( x'_n, y'_n, z'_n \) - analogous to the coordinates corresponding closest edges \( x_j, y_j, z_j \).
- \( x_j, y_j, z_j \) - coordinates of the beginning of the coordinate system \( j \) -th device in relation to the robot coordinate system.

- \( r'_n \) - coordinate system of the robot \( x_r, y_r, z_r \).
- \( r'_n \) - coordinates of the object \( O \), placed on the device or shortly after release.
- \( r_n \) - coordinates of the gripper relative to the coordinate system of the object \( x_r, y_r, z_r \).
- \( B_n \) - matrix which calculates the coordinates in the rotation device relative to the robot.

\[ B = \begin{bmatrix} \cos \alpha & -\sin \alpha & 0 \\ \sin \alpha & \cos \alpha & 0 \\ 0 & 0 & 1 \end{bmatrix} \]

- \( C_n \) - matrix that takes into account the different types of orientation of the object relative to the apparatus.

Furthermore, for each thus recalculated position coordinates of the robot gripper determined as:

\[ (r_n)_p = r_{cx} + r'_n \quad (r'_n)_p = r_{cx} + r'_n. \]

- \( r_{cx} \) - coordinate position of the gripper relative to the coordinate system of the robot \( x_r, y_r, z_r \).
- \( r_{cx} \) - coordinates of the coordinate system installations \( x_j, y_j, z_j \) to the robot coordinate system \( x_r, y_r, z_r \) at an angle \( \alpha \) enclosed by the two coordinate systems.

After converting the coordinates of the approximated edges of the elements in the coordinate system of the robot is determined by moving the position of the coordinate system of the gripper relative to the coordinate system of the robot according to the formula:

\[ r_{cx} = r_j + B_n (r_n + C_n r_p) + r_j, \]

where 

\[ r_{cx} = \begin{bmatrix} x_c \\ y_c \\ z_c \end{bmatrix}, \quad r_n = \begin{bmatrix} x_n \\ y_n \\ z_n \end{bmatrix}, \quad r_p = \begin{bmatrix} x_p \\ y_p \\ z_p \end{bmatrix}, \]

- \( x_c, y_c, z_c \) - coordinates of the point \( O \) relative to the system \( x_r, y_r, z_r \).
- \( x_n, y_n, z_n \) - coordinates of the gripper relative to the coordinate system of the object \( x_r, y_r, z_r \).
- \( x_j, y_j, z_j \) - variable position of the gripper for handling the direction of respective axes of coordinates of the robot.

\[ r'_n = \begin{bmatrix} x'_n \\ y'_n \\ z'_n \end{bmatrix}, \quad r'_n = \begin{bmatrix} x'_n \\ y'_n \\ z'_n \end{bmatrix} \]

where 

\( x'_n, y'_n, z'_n \) - edges cuboid, most remote in the positive direction of the axis robot \( x_r, y_r, z_r \).
coordinates of the edges of the m-th block a maximum distance in the positive
direction of the coordinate axes of the robot,
- analogous coordinates, corresponding closest edges.

These coordinates elements of the robot and the
devices are expressed in a single coordinate system,
which allows the comparison and elimination of
collisions of the robot with the device.

2. Analytical Determination of the Position
of the Manipulated Object when Performing
Manipulation Activity in the Production System

Location description of mounted object is closely
related to the issue of zonal projections. It has a
particular impact on the size of the robot handling
area. If the robot movements in operating the
equipment, there is a need to determine the position
of the robot with respect to a well-defined starting
point. This place, assign a coordinate (stationary)
system \((O, x, y, z)\). The system \((O_1, x_1, y_1, z_1)\)
is the coordinate system of the robot (moving), system
\((O_2, x_2, y_2, z_2)\) is the coordinate system of process
equipment and the coordinate system \((O_s, x_s, y_s, z_s)\)
being a coordinate system the object itself (Fig. 2).

![Fig. 2: Coordinate system for direct movement.](image)

If we have a matrix that describes the position
of the machine relative to the robot \((M_{rs})\), matrix that
determines the position of the object relative to
the machine \((M_{zs})\) and the matrix that determines
the position of the robot relative to the stationary
coordinate system \((M_{pv})\), can be expressed in the
matrix \((M_{rvs})\) which determines the position of the
object relative to the robot.

\[
M_{rs} = M_{rvs} \cdot M_{rs}
\]

where

\[
M_{rs} = M_{pv} \cdot M_{zs}
\]

The matrix \(M_{pv}\) has generally the form:

\[
M_{pv} = \begin{bmatrix}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
a & b & c & 1
\end{bmatrix}
\]

Position of the robot with respect to the
technological equipment expressed matrix \(M_{rs}\) has
the form:

\[
M_{rs} = \begin{bmatrix}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
a & b & c & 1
\end{bmatrix}
\]

Property of technological equipment, in general,
the matrix expressed by \(M_{zs}\):

\[
M_{zs} = \begin{bmatrix}
1 & 0 & 0 & 0 \\
0 & \cos \alpha_s & -\sin \alpha_s & 0 \\
0 & \sin \alpha_s & \cos \alpha_s & 0 \\
0 & 0 & 0 & 1
\end{bmatrix}
\]

The final position of the object relative to the
coordinate system \((O, x, y, z)\) is given by the
product of the matrices:

\[
M_{rs} = \begin{bmatrix}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
a & b & c & 1
\end{bmatrix} \begin{bmatrix}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
a & b & c & 1
\end{bmatrix} \begin{bmatrix}
1 & 0 & 0 & a_s \\
0 & \cos \alpha_s & -\sin \alpha_s & 0 \\
0 & \sin \alpha_s & \cos \alpha_s & 0 \\
0 & 0 & 0 & 1
\end{bmatrix}
= (A \ B \ C \ D)
\]
have the form:  

\[ A = x + a + a, \]
\[ B = \cos a_1 (y + b + b) + \sin a_1 (z + c + c), \]
\[ C = -\sin a_1 (y + b + b) + \cos a_1 (z + c + c), \]
\[ D = a_1 (x + a + a) + 1 \]

where \( x, y, z, x_1, y_1, z_1 \) are three-dimensional space vectors.

According to mathematical procedures for determining the position of an object is valid if the relative positions of components of the translational (straight). If the object moves in a circular path about a given radius of a matrix expressing the position of the robot to a coordinate system \((O, x, y, z)\) will have the form:

\[
M_{rs} = \begin{pmatrix}
    a_{11} & a_{12} & a_{13} & a_1 \\
    a_{21} & a_{22} & a_{23} & b_1 \\
    a_{31} & a_{32} & a_{33} & c_1 \\
    0 & 0 & 0 & 1
\end{pmatrix}
\]

Matrix \( M_{rs} \) and \( M_{rs} \) have the same form. The result is a statement of the final position of the object, which we obtain the product of the matrix \( M_{rs} \) and \( M_{rs} \).

\[
M_{rs} = M_{rs} \cdot M_{rs} \quad \text{where} \quad M_{rs} = M_{rs} \cdot \begin{pmatrix}
    1 & 0 & 0 & 0 \\
    0 & 1 & 0 & 0 \\
    0 & 0 & 1 & 0 \\
    a_1 & b_1 & c_1 & 1
\end{pmatrix}
\]

Mathematical computations of spatial-zonal optimization are relatively labor-intensive, is their algorithmization and computerized solutions are necessary.

3. Conclusions

The importance of integration in the construction components of production systems is their interconnections and optimal activity in the innovative projects is increasing. Modeling and simulation verification through mathematical models contained in advanced commercial but primarily purpose-developed software products is implemented in a number of future production projects that are addressed at the workplaces of the authors.
